SUMMARY

Milk production on farms in the United States in 1946, estimated at 119.7 billion pounds, was  $1\frac{1}{2}$  percent less than in 1945, but exceeded all other years. Milk production per cow reached a new high of 4,891 pounds, 2 percent above the previous year. Milk cow numbers, estimated at 24.5 million head, declined for the second successive year and were about 5 percent below the 1944 peak. Milk production per capita in 1946 was less than in any of the recent war years, but higher than in any year from 1924 through 1940.

The Nation's dairy manufacturing plants in 1946 turned out the smallest volume of creamery butter in a quarter century, 1,152 million pounds, or about 15 percent under 1945. In contrast, ice cream production at 740 million gallons, was an all time record. Production of dry whole milk products and nonfat dry milk solids in 1946, at 178 million and 638 million pounds respectively, was second only to the 1945 output. Factory output of cheese, and evaporated and condensed milk products was below 1945 and several other recent years, but still comparatively high. All factory dairy products combined accounted for  $50\frac{1}{2}$  billion pounds of whole milk, the smallest volume since 1937.

Fluid milk prices, manufacturers' selling prices for dry milk products, and prices paid farmers by fluid milk dealers and condenseries, all were the highest of record in 1946. Manufacturers' selling prices of evaporated and condensed milk were the highest since 1921.

## MILK COWS AND MILK PRODUCTION ON FARMS, 1946

Milk production on farms in the United States in 1946 was 119.7 billion pounds, on the basis of estimates for individual States released today. Production was  $\frac{1}{2}$  percent less than in 1945, but otherwise the highest on record. Numbers of milk cows on farms during 1946 totaled 24,479,000 head, the smallest number for any year since 1941. Milk production per cow reached a new high record of 4,891 pounds, encouraged by liberal feeding, good pastures and the retention of the better producing milkers in post-war readjustments. In 1946, milk production per capita averaged 850 pounds, basis total United States population, the lowest in a half-dozen years, but higher than in any year of the 1924-40 period. Annual estimates of numbers of milk cows on farms, milk and butterfat production per cow, total milk production, and milk production per capita for the United States in recent years are shown in Table 1.

The number of milk cows on farms was on the down grade throughout 1946 but toward the end of the year the rate of decline appeared to be slackening. From the beginning to the end of the year, numbers decreased about 2 percent, compared with 3 percent in the calendar year 1945, and about 4 percent between mid-1945 and mid-1946. It appears that readjustments in milking herds, which were sharp in the year following V.J. day, began to ease off under the rise in prices for dairy products in the last half of 1946. The annual number of milk cows for 1946 was about  $3\frac{1}{2}$  percent less than in 1945 and 5 percent below the record high numbers in 1944. It was, however, still 5 percent above the 1938 low point of the decline following the severe droughts of the middle 1930's. The decline in numbers from 1945 was general throughout the country with sharpest changes in the Great Plain and Rocky Mountain States.

Milk production per cow in 1946 was 2 percent above 1945 and an all time high. The unusually high level was evident throughout most of the year, with each month after February at new high records for the month. A high rate of production per cow in 1946 was favored by liberal grain and concentrate feeding and by good, though not exceptional, pasture conditions. The amount of grain and concentrates fed per cow was slightly below the 1945 level but otherwise the highest on record dating back through 1931. Seasonal average dairy pasture condition, though well below the 1942 and 1945 levels, was generally good except in the western Great Lake States, the southern Plains and the Southwest. Improving potential milk producing capacity of the average milk cow has also apparently been a factor in the high level of milk production per cow established in 1946. In the sharp culling of milking herds that has taken place since 1944, many low producers have been eliminated. The remaining cows better reflect such long-term improvement in milk producing ability as has been brought about by improved breeding, feeding, and management practices. Sharpest increases in milk production per cow over 1945 were in the West North Central and Rocky Mountain areas where the reduction in milk cow numbers has been greatest.

The seasonal trend of milk production in 1946 was appreciably different from that of 1945. At the beginning of the year, monthly production was 3 percent under the corresponding month of 1945 and, on a seasonally adjusted basis, equivalent to an annual rate of 116 billion pounds. Monthly milk production stayed below the 1945 level until November. (See Table 2) In the fall of 1946 production was well maintained in contrast with sharp declines in the similar period of 1945. In December, milk production was 2 percent above the same month a year earlier, and equivalent to an annual rate of about 118 billion pounds per year. Throughout all of 1946 monthly milk production was well above the 1935-44 average, ranging from 11 percent above in April and August to 8 percent above in several other months.

Wisconsin, the Nation's leading milk State, produced 15.7 billion pounds of milk during 1946, the greatest amount on record and 2 percent above last year. In eight other States milk production exceeded 5 billion pounds during 1946. In order they are Minnesota 8.5 billion pounds; New York, 7.8; Iowa, 6.7; California 5.9; Michigan, 5.7; Illinois, 5.6; Pennsylvania, 5.3; and Ohio, 5.2. In nine States -- New

1/ Revised.

2/ Preliminary.

Jersey, Wisconsin, Maryland, Virginia, Georgia, Florida, Kentucky, Tennessee and California -- 1946 milk production was the highest on record. These nine States plus Nebraska and Wyoming were the only ones where milk production during 1946 exceeded that in 1945. The increases amounted to 4 percent in Florida; 3 percent in California; Maryland and Georgia; and 2 percent or less in the other seven States. Increased milk production in 1946 over 1945 in these eleven States was attributable to more cows in three States, more milk per cow in six States and to both factors in two States. In 36 States, 1946 milk production showed declines from 1945 ranging up to 8 percent in Arkansas. In Oklahoma, Oregon, and Idaho milk production was down 7 percent from 1945. Declines were 5 percent or less in the rest of these 36 States. Milk production in the New England States was down 4 percent.

Milk production per cow during 1946 was at the highest level on record in 22 States. These included all East and West North Central States except the Dakotas; and all South Atlantic States except West Virginia, Georgia, and Florida; plus Alabama, Tennessee, Montana, Wyoming, Arizona, Utah, and Washington. In ten more States milk production per cow during 1946 was exceeded in only one or two years. In the remaining 16 States 1946 milk production per cow was exceeded in 3 or more years. The only area of really low milk production per cow in 1946 compared to previous years was Mississippi, Arkansas, Louisiana, Oklahoma, and Texas. Better than average pasture conditions in 1946, heavy feeding of grain and concentrates, good supplies of roughage, heavy culling of herds to eliminate the poor milkers, all contributed to the achievement of the very high rate of milk production per cow in 1946. Milk-feed and butterfat-feed price relationships were favorable for heavy milk production.

The average number of milk cows on farms during 1946 increased over 1945 in only five States. This increase was 6 percent in Florida, 3 percent in California, 1 percent in New Jersey, 1 percent in Georgia, and less than 1 percent in Wisconsin. In all of these, except Georgia, 1946 milk cow numbers were the highest on record. In Maryland and Nevada, 1946 milk cow numbers were unchanged from 1945 but in the other 41 States milk cow numbers were down. The greatest percentage decline occurred in Idaho where milk cow numbers dropped 10 percent from the 1945 figure. The Dakotas, Kansas and Oklahoma declined 8 percent; Oregon and Nebraska 7 percent; Montana, Arizona, New Mexico, Texas, and Arkansas 6 percent; Utah, Colorado, and Missouri 5 percent. East of the Mississippi River declines were 4 percent or less, except for Rhode Island. In all of the 12 leading creamery butter producing States, except Wisconsin, Michigan, and Ohio, 1946 milk cow numbers declined more than the United States decline of 3 percent. The declines were particularly sharp in the Dakotas, Nebraska and Kansas. In Iowa and Minnesota, the two leading butter States, milk cow numbers were down 4 percent from 1945.

Monthly milk production estimates for the 19 States for which estimates are now available are shown in Table 4. Milk production was below the 10-year average in most months of 1946 in five of these States -- North Dakota, Kansas, Oklahoma, Montana, and Oregon. In the other 14 States of this group monthly milk production was generally above average. The peak month of production is usually May or June in most Northern and Western States with November and December as low months of the year. In 3 Southeastern States -- Virginia and the Carolinas, the peak is normally somewhat later -- July and August -- and the lowest production in the short month of February.

1/ Revised. Excludes milk sucked by calves and milk produced by cows not on farms.

PRODUCTION, STOCKS AND PRICES  
OF SPECIFIED DAIRY PRODUCTS, 1946

Production of principal manufactured dairy products, except ice cream, was smaller in 1946 than in 1945, the Bureau of Agricultural Economics reports. The total net milk equivalent of manufactured dairy products in 1946 was the lowest of record since 1937. The whole milk equivalent of these items in 1946 was 50½ billion pounds, down 4 billion pounds from 1945 and almost 10 billion from the 1942 record.

Fluid milk consumption continued to take an increasing proportion of the total milk during 1946. Less milk was utilized in all of the major dairy products classifications in 1946 than in 1945, except for ice cream which was higher. Creamery butter output in 1946 required a milk equivalent of 23 billion pounds, a decline of more than 4 billion pounds from 1945. All cheese required 10.8 billion pounds of milk, a decrease of  $\frac{1}{4}$  billion pounds. Milk utilized in evaporated and condensed milk during 1946 was 7.3 billion pounds, 1.6 billion pounds less than 1945. Dry whole milk required approximately 1  $1\frac{1}{3}$  billion pounds of milk for manufacture, compared with 1  $2\frac{2}{3}$  billion in 1945. Ice cream production required 7.7 billion pounds of milk equivalent, a gain of 2.6 billion from 1945.

Creamery butter production in 1946 is estimated at 1,152,315,000 pounds, 15 percent less than 1945 and 33 percent below the 1940-44 average. During the first 8 months of last year, butter output ranged from 13 to 30 percent lower than in the corresponding months of 1945. In the last 4 months of the year, however, it rose progressively from 5 to 35 percent above the same month a year earlier.

Total American type cheese for 1946 was estimated at 794,105,000 pounds, a 9 percent decline from 1945 but a 3 percent gain from the 1940-44 average. Production during the first 9 months of the year ranged from 1 to 24 percent less than in the corresponding months of 1945. The level of production showed a gradual rise from April through December and for the last 3 months of the year registered gains of 3 percent, 18 percent, and 25 percent, respectively. In 1946, one-eighth of the total American cheese was made up of Colby, washed curd, high and low moisture Jack, and Monterey. Production of these other American varieties totaled 99,440,000 pounds for 1946, compared with 28,896,000 pounds in 1945 and 16,672,000 pounds in 1944, which is the first year that such data were gathered separately.

Production of total cheese - excluding full skin American, and cottage, pot, and bakers' cheese - is estimated at 1,091,830,000 pounds for 1946. This total is 2 percent below the record high output in 1945 but is 12 percent above the 1940-44 average. Production of all cheese other than American types in 1946 totaled 297,725,000 pounds, an increase of 21 percent from 1945 and the largest production on record. These varieties are mostly of foreign type cheeses. The sharp gains shown by these varieties were due to lack of imports of these types, termination of the restriction order (WFO-92), more favorable prices compared with American, and to the set-aside order on American cheddar cheese.

Estimated Swiss cheese production in 1946 was 56,275,000 pounds, 12 percent above the 1945 output and a new high record. Brick and Munster cheese output totaled 16,470,000 pounds, an 11 percent gain from the record low of 1945. Limburger cheese production was 9,195,000 pounds, an increase of 4 percent from 1945. However, a new high record was established by cream and Neufchatel cheese in 1946. At 74,875,000 pounds, the total of the two varieties was 8 percent larger than 1945. Production of Italian cheese was 69,525,000 pounds, 4 percent above the 1945 record high. Production of Italian varieties is now greater than any single foreign variety of cheese. Production of Blue Mold in 1946 was 13,330,000 pounds, an increase of 36 percent from 1945. Data on Blue Mold cheese were not gathered separately prior to 1943. All unclassified varieties were sharply higher in 1946.

than in 1945. Output of these varieties was 58,055,000 pounds, compared with only 25,828,000 pounds in 1945, a gain of 125 percent.

Canned evaporated milk production totaled 3,081,550,000 pounds, 18 percent below 1945 and 2 percent less than the 1940-44 average. Only during the last 2 months of 1946 did production of evaporated milk exceed the output of a year earlier. Production of all canned condensed milk, both whole and skimmed, was 112,880,000 pounds in 1946, down 22 percent from 1945 but 12 percent above the 1940-44 average. Output in 1946 was lower in every month of the year than in the corresponding month of 1945.

During the first 5 months of 1946, manufacturers stocks of evaporated milk at the end of each month were sharply lower than on the corresponding date a year earlier ranging from 27 to 62 percent less. For the last 7 months of the year, stocks increased irregularly, being 5 percent above a year earlier on June 30 and ranging up to 80 percent higher than a year earlier on December 31. Stocks of canned condensed milk held by manufacturers on the last day of each month were from 19 to 51 percent lower than a year earlier for the first 8 months of 1946. Gains from a year earlier were shown from September through November, but a slight decline was shown at the end of December compared with the same date in 1945.

Manufacturers' selling prices of evaporated whole milk in 1946 were the highest since 1921, averaging \$4.90 per case of 48 14 $\frac{1}{2}$ -oz. cans compared with \$4.15 per case in the three previous years when price ceilings were in effect. The ceilings on evaporated milk were raised 25 cents per case on May 20 and 35 cents on June 17. Ceilings were completely removed on July 1. The monthly average price ranged from \$4.14 to \$5.88 per case during 1946. Manufacturers selling prices of condensed milk averaged \$7.00 per case of 48 14-oz. cans during 1946, the highest since 1920. During the first 6 months of the year, prices remained at \$6.33 per case under ceilings established by O.P.A. After ceilings were removed on July 1 prices rose each successive month until they reached \$8.25 in December. Prices paid producers by condenseries averaged \$3.36 per hundredweight during 1946 for milk of 3.5 percent butterfat. This 1946 average is the highest of record and compares with \$2.63 for 1945. Prices increased each month from \$2.70 in January to \$4.30 in November, then declined to \$4.18 in December.

Production of combined spray and roller dried nonfat milk solids totaled 638,260,000 pounds in 1946, a decrease of 1 percent from 1945 but a gain of 36 percent from the 1940-44 average. Production of spray dried nonfat milk solids is estimated at 351,800,000 pounds, a gain of 18 percent from 1945. The monthly output of this product in 1946 was higher than a year earlier in all months except November. Output of roller dried nonfat milk solids was 286,460,000 pounds in 1946, compared with 345,004,000 pounds in 1945, a decrease of 17 percent. Production in all months of 1946 was lower than in the corresponding months of 1945. Dry skim milk for animal feed is estimated at 15,525,000 pounds, another low record and 12 percent less than in 1945. For the first time since 1937, dry whole milk production failed to show an increase from the preceding year. Production totaled 178,465,000 pounds during 1946, 18 percent less than in 1945 but 97 percent more than the 1940-44 average. Only 15,345,000 pounds, or 9 percent of the dry whole milk output, was produced by the roller process while the remainder was spray dried. Production of dry buttermilk totaled 40,325,000 pounds for 1946, a decrease of 17 percent from 1945.

Manufacturers' stocks of nonfat dry milk solids at the end of each month in the first half of 1946 were sharply lower than a year earlier, but rose rapidly during the last half. These stocks on December 31 were 168 percent higher than a year earlier. Holdings of dry whole milk followed the same monthly pattern as nonfat dry milk solids. During the first half of 1946 stocks were sharply lower

than a year earlier but exceeded the same date of 1945 during the last half of the year. Starting at 14 percent below a year earlier on January 31, stocks were 100 percent above on September 30. Later months of the year remained above the 1945 levels, but gains were not so sharp as in September.

Manufacturers' selling prices of all dry milk products were at record high levels in 1946. Selling prices of nonfat dry milk solids averaged 14.51 cents per pound in 1946, compared with 14.06 cents in 1945. Average prices of dry skim milk for animal feed, at 9.62 cents per pound, in 1946 were the highest on record and compare with an average of 8.39 cents in 1945. Dry whole milk prices averaged 39.60 cents in 1946, compared with 37.62 cents for 1945. Manufacturers' prices of dry buttermilk were 11.50 cents in 1946, compared with 10.46 cents in 1945, an increase of more than 1 cent per pound.

Milk dealers' buying prices for standard grade milk averaged \$3.92 per hundredweight in 1946, the highest on record. Buying prices held at about \$3.25 per hundredweight for both 1944 and 1945. During the first few months of 1946 buying prices were fairly steady but after subsidies were terminated, prices advanced rather rapidly in order to compensate for subsidy payments. A total increase of \$1.69 per hundredweight occurred during the year, with December prices averaging \$4.96 per hundredweight. By regions, average buying prices in 1946 varied from \$3.48 per hundredweight in the West North Central States to \$4.56 in the New England States.

Retail prices of milk delivered to homes in 25 cities averaged 16.91 cents per quart for 1946, not only the highest of record but also more than 2 cents above the 1945 average. Prices remained practically unchanged through May but when the price ceiling was raised on May 29, retail prices rose to 15.72 cents per quart. After termination of ceilings on June 30, retail prices rose each month until they reached an average of 19.46 cents in December. All of the 25 cities for which data are published showed gains in 1946 from 1945. Annual average retail prices in these cities ranged from 14.75 cents per quart in Salt Lake City to as high as 20.58 cents per quart in Jacksonville, Fla., depending on the quality of the milk, prices paid producers, services rendered by dealers, as well as other economic factors.
